10	It is sometimes desirable to protect a design used in a PLD from being
11	copied. According to the present invention, the design is encrypted, then loaded
12	into a PLD, then decrypted, and then loaded into the configuration memory of the
13	PLD. An attacker could relocate the design to a visible part of the PLD and learn
14	the design. The present invention prevents design relocation by attaching address
15	information to the encryption key or by encrypting an address where the design is
16	to be loaded as well as encrypting the design itself. Thus, if an attacker tries to
17	load the design into a different part of the PLD, the encrypted design will not
18	decrypt properly.
